Math and Engineering Fundamentals

EXAM AREA

Assigned Number **(DO NOT SIGN YOUR NAME)**

-- Please sign your name on the back of this page --

GEORGIA INSTITUTE OF TECHNOLOGY

The George W. Woodruff School of Mechanical Engineering

Nuclear Engineering

Ph.D. Qualifiers Exam

Fall Quarter, 1996

Day 1

Instructions

1. You must complete 1 of the 2 problems in each of the following areas (for a total of 7 questions). **DO NOT COMPLETE MORE THAN ONE QUESTION IN EACH AREA.**
 - a. Mathematics
 - b. Basics in Fusion
 - c. Nuclear Physics
 - d. Basics in Fission
 - e. Radiation Detection
 - f. Radiation Protection
 - g. Thermodynamics and Mechanics
2. Place your identifying code letter on the top right corner of each page of your question and answer sheets.
3. Use a separate page for each answer sheet (no front to back answers).
4. The question number should be shown on each answer sheet.
5. Staple your question sheet to your answer sheets and turn in.

Nuclear Physics

- NE.I.1. a. If you were to bombard ^{63}Cu ($Z = 29$) with energetic **alpha** particles, what would be the minimum kinetic energy of the **alpha** particles before we could expect any significant nuclear reactions to occur? (i.e. to overcome the Coulomb barrier)

answer _____ MeV

- b. For this bombardment, what would be the product, ^A_ZX , of a ^{63}Cu (α , p) reaction?

Write the balanced nuclear reaction equation, showing **A**, **Z**, and **N** for each term.

- c. What would be the **Q** for this reaction? The atomic mass of ^{63}Cu is 62.929599μ ; of ^AX is 65.926035μ ?

answer _____ MeV

Useful Constants:

$1 \text{ Ci} = 3.7 \times 10^{10} \text{ dis/sec}$, $1 \text{ eV} = 1.60 \times 10^{-19} \text{ Joule}$, $e = 1.60 \times 10^{-19} \text{ Coulomb}$

$1 \mu = 931.502 \text{ MeV}/c^2 = 1.660566 \times 10^{-27} \text{ kg}$ $k_{\text{coulomb}} = 1/4\pi\epsilon_0 = 9.0 \times 10^9 \text{ Newton}\cdot\text{meter}^2/\text{Coulomb}^2$

$m(^1\text{H}) = 1.007825 \mu$, $m(\text{n}) = 1.008665 \mu$, $m(\text{e}) = 5.485803 \times 10^{-4} \mu = 0.511 \text{ MeV}/c^2 = 9.11 \times 10^{-31} \text{ kg}$

$m(^4\text{He}) = 4.002603 \mu$.

Nuclear Physics

NE.1.2. A 10 MeV gamma ray is Compton scattered at 75°:

a. What is the energy of the scattered photon? answer _____ MeV

b. What is the energy of the scattered electron? answer _____ MeV

Useful Constants:

1 Ci = 3.7×10^{10} dis/sec, 1 eV = 1.60×10^{-19} Joule, e = 1.60×10^{-19} Coulomb

1 μ = $931.502 \text{ MeV}/c^2 = 1.660566 \times 10^{-27}$ kg $k_{\text{coulomb}} = 1/4\pi\epsilon_0 = 9.0 \times 10^9$ Newton•meter²/Coulomb²

m (¹H) = 1.007825 μ , m (n) = 1.008665 μ , m (e) = $5.485803 \times 10^{-4} \mu = 0.511 \text{ MeV}/c^2 = 9.11 \times 10^{-31}$ kg

m (⁴He) = 4.002603 μ .

Fusion

- NE.1.3 A tokamak has four magnetic field components - a toroidal field produced by a set of toroidal field coils, a poloidal field produced by the plasma current, a "vertical" (or equilibrium) field produced by a set of poloidal ring coils, and an "ohmic heating" field produced by a central solenoidal magnet. Describe the function of each of these 4 magnetic field components, giving governing equations.

Fusion

- NE.I.4. The materials in the "first wall" immediately surrounding a fusion plasma will be subjected to a large flux of 14 MeV neutrons. Discuss the fundamental (microscopic) damage mechanisms and the secondary (macroscopic, observable) damage to the first wall materials.

Fission

- NE.I.5 Consider an infinite slab reactor of uniform composition and thickness $2a$ (the slab edges are at $x = \pm a$). The reactor consists of uranium (10% U-235 and 90% U-238 by weight). At position $x = 0$ (at the center of the slab) there is an infinitely thin absorber with an infinitely large absorption cross section. Assume that one-speed diffusion theory is valid and that the uranium density, microscopic cross sections and the atomic weight for each isotope are given.
- Set up the detailed differential equation and boundary condition for this system.
 - Find the critical ($k_{eff}=1$) dimension a in terms of the given (assumed) parameters.

Fission

- NE.I.6 A triangular pitch is used in a fuel element with a pitch to diameter ratio of 1.000. The fuel pellet diameter is 0.3649 in. The fuel pin diameter is 0.422 in. The clad thickness is 0.0243 in. UO_2 density is 10.14 g/cm^3 . Enrichment = 3.35%. Determine the atom density of U^{235} in the fuel cell.

Mathematics

- NE.I.7. Laplace's equation in cylinder coordinate, assuming that ϕ is independent of the z coordinate, is

$$\frac{1}{r} \frac{\partial}{\partial r} \left(r \frac{\partial \phi}{\partial r} \right) + \frac{1}{r^2} \frac{\partial^2 \phi}{\partial \theta^2} = 0$$

Find the general solution to this equation.

Mathematics

NE.I.8. Four radionuclides are present in a mixture (they are not members of a decay chain). You are to determine the activity of each radionuclide that was originally present in the mixture at $t = 0$. You know the decay constants ($\lambda_A, \lambda_B, \lambda_C, \lambda_D$) of each of the radionuclides. One way to determine the initial activities is to solve the total activity equation.

$$A_{\text{tot}}(t) = Ae^{-\lambda_A t} + Be^{-\lambda_B t} + Ce^{-\lambda_C t} + De^{-\lambda_D t}$$

where A, B, C, and D are the activities of the four radionuclides at time zero. If one has a set of activity measurements, the values of A, B, C, and D could be found by linear least-squares fitting. Remember, "linear" does not mean a straight line fit, rather a fit of linear combination of functions.

- The first step in performing such a fit is to write the equation for the sum of the residuals (you might also think of it as the variance). Write that equation.
- From the sum of the residuals, derive the set of equations (four of them) which yields the best fit to values of A, B, C, and D in the least-squares sense.
- What are the best fit values of A, B, C, and D for the following set of data.

| <u>T(min)</u> | <u>Total Activity (Ci)</u> |
|---------------|----------------------------|
| 5 | 2.7 |
| 15 | 1.6 |
| 25 | 1.1 |
| 45 | 0.6 |
| 60 | 0.4 |

Other Data:

| <u>Radionuclide</u> | <u>T_{1/2} (min)</u> |
|---------------------|------------------------------|
| A | 2.0 |
| B | 8.0 |
| C | 15.0 |
| D | 30.0 |

Radiation Detection

NE.I.9. You were to determine the thermal neutron flux in the thermal column of Georgia Tech Nuclear Research Reactor. You irradiated a thin foil of ^{115}In of 100 mg in the thermal column for 5 hours, and then took it out and counted for 1 hour using a GM counter. The counter recorded a total of 400 counts.

Data given:

- (1) the thermal activation cross section for ^{115}In is 160 barns,
- (2) the half-life of $^{116\text{m}}\text{In}$ is 54 minutes,
- (3) the detection efficiency of the counter for measuring a $^{116\text{m}}\text{In}$ decay is 1%, and
- (4) the contribution from background during counting is zero.

Estimate the thermal neutron flux and its uncertainty (i.e. the expected deviation).

Radiation Detection

- NE.I.10. In a very-low-count-rate experiment, the mean count rate was determined to be 1 count per minute. What is the probability that the counting system will record less than 5 counts in 10 minutes.

Thermodynamics and Mechanics

NE.I.11. The first of the Gibbs (Tds) equations is

$$Tds = du + Pdv$$

where

T = Temperature

s = Specific entropy

u = Specific internal energy

P = Pressure

v = Specific volume

- a. What thermodynamic law does the equation represent and what type of processes does it apply to?
- b. For an ideal gas with constant properties going through an arbitrary process, derive a relation for entropy change, $s_2 - s_1$.

Thermodynamics and Mechanics

- NE.I.12. During the initial startup testing of a two-loop, 1600 MWt PWR, steady state operation was established at the conditions listed in Table 1. In order to test the pressurizer response to load changes, the operator disabled all the pressurizer heaters and opened one of the steam generator relief valves, thereby releasing steam to the atmosphere and increasing the total main steam flow rate by nearly 10%. (**Attached two sheets**)
- a. Estimate the initial primary system cooldown rate ($^{\circ}\text{F/hr}$) following steam generator relief valve opening.
 - b. Estimate the time required for the pressurizer low pressure alarm to sound indicating that the pressurizer pressure has decreased to 2100 psia. (**List all assumptions**).

Table 1

Primary System Conditions Prior to Opening of SG Relief Valve

| | |
|---|------------------------|
| Core Power Level | 50% |
| Primary Coolant Average Temperature | 572 $^{\circ}\text{F}$ |
| Pressurizer Pressure | 2200 psia |
| Total Primary System Volume (excluding the Pressurizer) | 5600 ft^3 |
| Pressurizer Volume | 1000 ft^3 |
| Saturated Liquid Volume in the Pressurizer | 500 ft^3 |

Table 2: Saturated Steam: Pressure Table

| Abs Press Lb/Sq In. p | Temp Fahr t | Specific Volume | | | Enthalpy | | | Entropy | | | Abs Press. Lb/Sq In. p |

Radiation Protection

- NE.I.13 An accidental discharge of ^{89}Sr into a reservoir resulted in a contamination level of 37 Bq ($10^{-3}\mu\text{Ci}$) per cm^3 of water.
- Using the basic radiological health criterion of the ICRP-26, would this water be acceptable for drinking purposes for the general public if the turn-over half-time of the water in the reservoir is 30 days?
 - If the water were ingested continuously, what maximum body burden would be reached?
 - How long after ingestion started would this maximum occur?
 - What would be the absorbed dose during the first year?
 - What would be the absorbed dose during 50 years following the start of ingestion?

Data:

Deposition fraction of ^{89}Sr in bone is approximately 0.21.
Effective energy of ^{89}Sr in bone is approximately 2.8 MeV per transformation.
Drinking water consumption is about 2.2 liter per day.

Radiation Protection

NE.I.14. Calculate the threshold energy for the (γ, n) reaction of ^{144}Sm . What is the energy of a neutron produced by absorption of a 15-MeV photon?

Data:

| <u>Nuclide</u> | <u>Mass Difference (MeV)</u> |
|-------------------|------------------------------|
| neutron | 8.07 |
| ^{143}Sm | -79.60 |
| ^{144}Sm | -81.98 |
